Our algorithm extends and combines the techniques of Leven and Sharir and of Sifrony and Sharir used for the case in which B is a line segment (a ladder). It also makes use of the results of Kedem and Sharir on the planning of translational motion of B amidst polygonal obstacles, and of a recent result of Leven and Sharir on the number of free critical contacts of B with such polygonal obstacles. 1. Introduction. Let B be a convex polygonal object having k vertices and edges, free to move (translate and rotate) in an open two-dimensional space V bounded by a collection of polygonal obstacles(walls) having altogether n corners. The problem studied in this paper is to plan automatically a continuous obstacle avoiding motion of B between any two specified initial and final placements; cf. Fig. 1.1.
